

Kju:Ti Question Trees

What is Kju:Ti?

It...

- ...is a digital communication platform where users can ask and answer questions within a prescribed framework, or just share knowledge amongst each other.
- ...is designed to be experimental, fun and to make users eager to acquire knowledge.
- ...allows understanding the values embedded in neighbourhoods while raising awareness for the needs of the local population.

Questions entered in Kju:Ti arrive as push notifications on other users' phones and can be answered with binary and multiple-choice options, numeric, free text, geotag or camera.

Kju:Ti Development Status

By May 2021, the back-end development, incl. data model and push notifications, was ready for use. User registration was not automated by then. Also, for the content management an expert was still needed to set nodes and link them one to another. As for the front-end development, a basic user interface was provided and required some polishing and adaptation to your target group. Kju:Ti is written in JSON and freely accessible on [GitHub](#).

For further information and/or consultation on how to develop and implement Kju:Ti for your case, please get in touch [with the Kju:Ti team](mailto:office@oikoplus.com): office@oikoplus.com.
